Matematicas (2)

2.1 Ecuaciones

$$ax^2+bx+c=0 \Rightarrow x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$$

Es extremos es dado por $x=-b/2a$.

$$\begin{matrix} ax+by=e \\ cx+dy=f \end{matrix} \Rightarrow \begin{matrix} x=\dfrac{ed-bf}{ad-bc} \\ y=\dfrac{af-ec}{ad-bc} \end{matrix}$$

En general dado un sistema $Ax=b$, la solucion de una variable x_i es dada por

$$x_i=\frac{\det A_i'}{\det A}$$

donde A_i' es A con la i-esima columna remplazada por b.

2.2 Recurrencias

Si $a_n=c_1a_{n-1}+\cdots+c_ka_{n-k}$, y $r_1,\ldots,r_k$ son raices distintas de $x^k+c_1x^{k-1}+\cdots+c_k$, hay $d_1,\ldots,d_k$ tal que

$$a_n=d_1r_1^n+\cdots+d_kr_k^n.$$

Raices diferentes r se convierten en factores polinomiales, e.g. $a_n=(d_1n+d_2)r^n$.

2.3 Trigonometria

$$\sin(v+w)=\sin v\cos w+\cos v\sin w$$
$$\cos(v+w)=\cos v\cos w-\sin v\sin w$$

$$\tan(v+w)=\frac{\tan v+\tan w}{1-\tan v\tan w}$$
$$\sin v+\sin w=2\sin\frac{v+w}{2}\cos\frac{v-w}{2}$$
$$\cos v+\cos w=2\cos\frac{v+w}{2}\cos\frac{v-w}{2}$$
$$(V+W)\tan(v-w)/2=(V-W)\tan(v+w)/2$$

donde V,W son longitudes de angulos de lados opuestos v,w.

$$a\cos x+b\sin x=r\cos(x-\phi)$$
$$a\sin x+b\cos x=r\sin(x+\phi)$$

donde $r=\sqrt{a^2+b^2}, \phi=\operatorname{atan2}(b,a)$.

2.4 Geometria

2.4.1 Triangles

Longitudes de los lados: a,b,c

Semiperimetro: $p=\dfrac{a+b+c}{2}$

Area: $A=\sqrt{p(p-a)(p-b)(p-c)}$

Circumradio: $R=\dfrac{abc}{4A}$

Inradio: $r=\dfrac{A}{p}$

Longitud de la mediana (Divide el triangulo en dos triangulos con el mismo area): $m_a=\frac{1}{2}\sqrt{2b^2+2c^2-a^2}$

Longitud de la bisectriz (Divide un angulo en dos):

$$s_a=\sqrt{bc\left[1-\left(\frac{a}{b+c}\right)^2\right]}$$

Teorema del seno: $\dfrac{\sin\alpha}{a}=\dfrac{\sin\beta}{b}=\dfrac{\sin\gamma}{c}=\dfrac{1}{2R}$

Teorema del coseno: $a^2=b^2+c^2-2bc\cos\alpha$

Teorema de la tangente: $\dfrac{a+b}{a-b}=\dfrac{\tan\frac{\alpha+\beta}{2}}{\tan\frac{\alpha-\beta}{2}}$

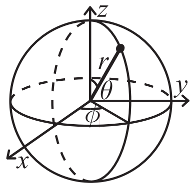
2.4.2 Cuadrilateros

Con lados de longitud a,b,c,d, diagonales e,f, angulos de la diagonal θ, area A y "flujo magico" $F=b^2+d^2-a^2-c^2$:

$$4A=2ef\cdot\sin\theta=F\tan\theta=\sqrt{4e^2f^2-F^2}$$

Para cuadrilateros ciclicos la suma de los angulos opuestos es 180°, $ef=ac+bd$, y $A=\sqrt{(p-a)(p-b)(p-c)(p-d)}$.

2.4.3 Coordenadas esfericas



$$x = r\sin\theta\cos\phi \qquad r = \sqrt{x^2+y^2+z^2}$$
$$y = r\sin\theta\sin\phi \qquad \theta = \arccos(z/\sqrt{x^2+y^2+z^2})$$
$$z = r\cos\theta \qquad \phi = \arctan(y/x)$$

2.5 Derivadas e Integrales

$$\frac{d}{dx}\arcsin x = \frac{1}{\sqrt{1-x^2}} \qquad \frac{d}{dx}\arccos x = -\frac{1}{\sqrt{1-x^2}}$$
$$\frac{d}{dx}\tan x = 1+\tan^2 x \qquad \frac{d}{dx}\arctan x = \frac{1}{1+x^2}$$
$$\int \tan ax = -\frac{\ln|\cos ax|}{a} \qquad \int x\sin ax = \frac{\sin ax - ax\cos ax}{a^2}$$
$$\int e^{-x^2} = \frac{\sqrt{\pi}}{2}\operatorname{erf}(x) \qquad \int xe^{ax}dx = \frac{e^{ax}}{a^2}(ax-1)$$

Integracion por partes:

$$\int_a^b f(x)g(x)dx = [F(x)g(x)]_a^b - \int_a^b F(x)g'(x)dx$$

2.6 Sumas

$$c^a + c^{a+1} + \cdots + c^b = \frac{c^{b+1}-c^a}{c-1}, c \neq 1$$

$$1+2+3+\cdots+n = \frac{n(n+1)}{2}$$
$$1^2+2^2+3^2+\cdots+n^2 = \frac{n(2n+1)(n+1)}{6}$$
$$1^3+2^3+3^3+\cdots+n^3 = \frac{n^2(n+1)^2}{4}$$
$$1^4+2^4+3^4+\cdots+n^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$$

2.7 Series

$$e^x = 1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\ldots, (-\infty < x < \infty)$$
$$\ln(1+x) = x-\frac{x^2}{2}+\frac{x^3}{3}-\frac{x^4}{4}+\ldots, (-1 < x \leq 1)$$
$$\sqrt{1+x} = 1+\frac{x}{2}-\frac{x^2}{8}+\frac{2x^3}{32}-\frac{5x^4}{128}+\ldots, (-1 \leq x \leq 1)$$
$$\sin x = x-\frac{x^3}{3!}+\frac{x^5}{5!}-\frac{x^7}{7!}+\ldots, (-\infty < x < \infty)$$
$$\cos x = 1-\frac{x^2}{2!}+\frac{x^4}{4!}-\frac{x^6}{6!}+\ldots, (-\infty < x < \infty)$$

2.8 Probabilidad

Sea X una variable aleatoria con probabilidad $p_X(x)$ de tomar el valor x. Su esperanza es dada por $\mu = \mathbb{E}(X) = \sum_x xp_X(x)$ y varianza $\sigma^2 = V(X) = \mathbb{E}(X^2) - (\mathbb{E}(X))^2 = \sum_x (x-\mathbb{E}(X))^2 p_X(x)$ donde σ es la desviacion estandar. Si X es una varibale contina la funcion de densidad es $f_X(x)$ y la suma de probabilidades con $p_X(x)$ es remplazada por la integral con $f_X(x)$.

La esperanza es lineal:

$$\mathbb{E}(aX+bY) = a\mathbb{E}(X) + b\mathbb{E}(Y)$$

Para X e Y independientes,

$$V(aX+bY) = a^2V(X) + b^2V(Y).$$

2.8.1 Distribuciones discretas

Binomial distribution

El numero de aciertos n independientes en experimentos si/no , donde cada acierto tiene una probabilidad de p es $\mathrm{Bin}(n,p)$, $n = 1, 2, \ldots$, $0 \leq p \leq 1$.

$$p(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

$$\mu = np, \; \sigma^2 = np(1-p)$$

$\mathrm{Bin}(n,p)$ es aproximadamente $\mathrm{Po}(np)$ para pequeños p.

DIstribucion del primer acierto (Geometrica)

El numero de intentos necesarios hasta el primer acierto en experimentos de si/no, donde cada acierto tiene una probabilidad de p es $\mathrm{Fs}(p)$, $0 \leq p \leq 1$.

$$p(k) = p(1-p)^{k-1}, \; k = 1, 2, \ldots$$

$$\mu = \frac{1}{p}, \; \sigma^2 = \frac{1-p}{p^2}$$

DIstribucion de Poisson

El numero de eventos ocurridos en un tiempo determinado t si esos eventos ocurren con una media de κ independientemente del tiempo desde el ultimo suceso es $\mathrm{Po}(\lambda)$, $\lambda = t\kappa$.

$$p(k) = e^{-\lambda}\frac{\lambda^k}{k!}, k = 0, 1, 2, \ldots$$

$$\mu = \lambda, \; \sigma^2 = \lambda$$

2.8.2 Distribuciones continuas

Distribucion uniforma

Si la funcion de densidad es constante entre a y b y es 0 fuera de $\mathrm{U}(a,b)$, $a < b$.

$$f(x) = \begin{cases} \frac{1}{b-a} & a < x < b \\ 0 & \text{otherwise} \end{cases}$$

$$\mu = \frac{a+b}{2}, \; \sigma^2 = \frac{(b-a)^2}{12}$$

Distribucion exponencial

El tiempo entre eventos en un proceso de Poisson es $\mathrm{Exp}(\lambda)$, $\lambda > 0$.

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & x \geq 0 \\ 0 & x < 0 \end{cases}$$

$$\mu = \frac{1}{\lambda}, \; \sigma^2 = \frac{1}{\lambda^2}$$

Distribucion normal

Mucho de los sucesos aleatorios reales con media μ y varianza σ^2 son bien descritos por $\mathcal{N}(\mu, \sigma^2)$, $\sigma > 0$.

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

If $X_1 \sim \mathcal{N}(\mu_1, \sigma_1^2)$ and $X_2 \sim \mathcal{N}(\mu_2, \sigma_2^2)$ then

2.9 Cadenas de Markov

Una *Cadena de Markov* es un proceso aleatorio discreto con la propiedad de que el siguiente estado depende unicamente del estado actual. Sean $X_1, X_2, \ldots$ unas secuencia de variables aleatorias generadas por un proceso de Markov. Entonces hay una matriz de transicion $\mathbf{P} = (p_{ij})$, con $p_{ij} = \Pr(X_n = i | X_{n-1} = j)$, y $\mathbf{p}^{(n)} = \mathbf{P}^n \mathbf{p}^{(0)}$ es la distribucion de probabilidad para X_n (i.e., $p_i^{(n)} = \Pr(X_n = i)$), donde $\mathbf{p}^{(0)}$ es la distribucion incial.

Distribucion estacionaria

π es una distribucion estacionaria si $\pi = \pi\mathbf{P}$. Si la cadena de Markov es *irreducible* (es posible ir de cualquier estado a otro), entonces $\pi_i = \frac{1}{\mathbb{E}(T_i)}$ donde $\mathbb{E}(T_i)$ es el tiempo esperado entre dos visitas en el estado i. π_j/π_i es el numero experado de visitas en el estado j entre dos visitas del estado i.

Para un grafo conexo, no dirigido and no-bipartito, donde la la probabilidad de transicion es uniforme entre todos los vecinos, π_i es proporcional al grado del nodo i.

Ergodicidad

Una cadena de Markov es *ergodica* if the asymptotic si la distribucion asintotica es independiente del estado inicial de la distribucion. Una cadena de Markov finita es ergodica si es irreducible y *aperiodica* (i.e., el mcd de la longitud de los ciclos es 1). $\lim_{k\to\infty} \mathbf{P}^k = \mathbf{1}\pi$.

Absorvencia

Una cadena de Markov es una A-cadena si los estados pueden ser particionados en dos conjuntos $\mathbf{A}$ y $\mathbf{G}$, tal que todos los estados en $\mathbf{A}$ son absorventes ($p_{ii} = 1$), y tdos los estados en $\mathbf{G}$ acaban en un estado absorvente de$\mathbf{A}$. La probabilidad para absorver en un estado $i \in \mathbf{A}$, donde el estado inicial es j, es $a_{ij} = p_{ij} + \sum_{k\in\mathbf{G}} a_{ik}p_{kj}$. El tiempo esperado hasta la absorcion, donde el estado inicial es i, es $t_i = 1 + \sum_{k\in\mathbf{G}} p_{ki}t_k$.

Simplex.h

Description: Solves a general linear maximization problem: maximize $c^T x$ subject to $Ax \leq b$, $x \geq 0$. Returns -inf if there is no solution, inf if there are arbitrarily good solutions, or the maximum value of $c^T x$ otherwise. The input vector is set to an optimal x (or in the unbounded case, an arbitrary solution fulfilling the constraints). Numerical stability is not guaranteed. For better performance, define variables such that $x = 0$ is viable.
Usage: `vvd A = {{1,-1}, {-1,1}, {-1,-2}};`

Tridiagonal.h

Description: $x = \text{tridiagonal}(d, p, q, b)$ solves the equation system

$$\begin{pmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \\ \vdots \\ b_{n-1} \end{pmatrix} = \begin{pmatrix} d_0 & p_0 & 0 & 0 & \cdots & 0 \\ q_0 & d_1 & p_1 & 0 & \cdots & 0 \\ 0 & q_1 & d_2 & p_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \ddots & \ddots & \vdots \\ 0 & 0 & \cdots & q_{n-3} & d_{n-2} & p_{n-2} \\ 0 & 0 & \cdots & 0 & q_{n-2} & d_{n-1} \end{pmatrix} \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ \vdots \\ x_{n-1} \end{pmatrix}.$$

This is useful for solving problems on the type

$$a_i = b_i a_{i-1} + c_i a_{i+1} + d_i,\ 1 \leq i \leq n,$$

where a_0, a_{n+1}, b_i, c_i and d_i are known. a can then be obtained from

$$\{a_i\} = \text{tridiagonal}(\{1, -1, -1, ..., -1, 1\}, \{0, c_1, c_2, \ldots, c_n\}, \{b_1, b_2, \ldots, b_n, 0\}, \{a_0, d_1, d_2, \ldots, d_n, a_{n+1}\}).$$

Fails if the solution is not unique.
If $|d_i| > |p_i| + |q_{i-1}|$ for all i, or $|d_i| > |p_{i-1}| + |q_i|$, or the matrix is positive definite, the algorithm is numerically stable and neither `tr` nor the check for `diag[i] == 0` is needed.

4.4 Fourier transforms

FastFourierTransform.h

Description: fft(a) computes $\hat{f}(k) = \sum_x a[x] \exp(2\pi i \cdot kx/N)$ for all k. N must be a power of 2. Useful for convolution: conv(a, b) = c, where $c[x] = \sum a[i]b[x-i]$. For convolution of complex numbers or more than two vectors: FFT, multiply pointwise, divide by n, reverse(start+1, end), FFT back. Rounding is safe if $(\sum a_i^2 + \sum b_i^2)\log_2 N < 9 \cdot 10^{14}$ (in practice 10^{16}; higher for random inputs). Otherwise, use NTT/FFTMod.

Description: *Euler's* ϕ function is defined as $\phi(n) := \#$ of positive integers $\leq n$ that are coprime with n. $\phi(1) = 1$, p prime $\Rightarrow \phi(p^k) = (p-1)p^{k-1}$, m, n coprime $\Rightarrow \phi(mn) = \phi(m)\phi(n)$. If $n = p_1^{k_1} p_2^{k_2} ... p_r^{k_r}$ then $\phi(n) = (p_1 - 1)p_1^{k_1-1} ... (p_r - 1)p_r^{k_r-1}$. $\phi(n) = n \cdot \prod_{p|n}(1 - 1/p)$.
$\sum_{d|n} \phi(d) = n$, $\sum_{1 \leq k \leq n, \gcd(k,n)=1} k = n\phi(n)/2, n > 1$

Euler's thm: a, n coprime $\Rightarrow a^{\phi(n)} \equiv 1 \pmod{n}$.

Fermat's little thm: p prime $\Rightarrow a^{p-1} \equiv 1 \pmod{p}$ $\forall a$.

ContinuedFractions.h

Description: Given N and a real number $x \geq 0$, finds the closest rational approximation p/q with $p, q \leq N$. It will obey $|p/q - x| \leq 1/qN$.
For consecutive convergents, $p_{k+1}q_k - q_{k+1}p_k = (-1)^k$. ($p_k/q_k$ alternates between $> x$ and $< x$.) If x is rational, y eventually becomes ∞; if x is the root of a degree 2 polynomial the a's eventually become cyclic.

5.5 Ternas Pitagoricas

Las ternas pitagoricas son generadas de forma unica por

$$a = k \cdot (m^2 - n^2), \quad b = k \cdot (2mn), \quad c = k \cdot (m^2 + n^2),$$

con $m > n > 0$, $k > 0$, $m \perp n$, ni m o n par.

5.6 Primos

$p = 962592769$ es $2^{21} \mid p - 1$, puede ser util. Para hashing usar 970592641 (31-bit number), 31443539979727 (45-bit), 3006703054056749 (52-bit). Hay 78498 primos menores que 1 000 000.

Raices primitivas existen modulo cualquier potencia prima p^a, excepto para $p = 2, a > 2$, y hay muchos $\phi(\phi(p^a))$. Para $p = 2, a > 2$, el grupo $\mathbb{Z}_{2^a}^{\times}$ es isomorfo a $\mathbb{Z}_2 \times \mathbb{Z}_{2^{a-2}}$.

5.7 Estimates

$\sum_{d|n} d = O(n \log \log n)$.

EL numero de divisores de n es cercano a 100 para $n < 5e4$, 500 para $n < 1e7$, 2000 para $n < 1e10$, 200 000 para $n < 1e19$.

5.8 Mobius Function

$$\mu(n) = \begin{cases} 0 & n \text{ no tiene factores primos repetidos} \\ 1 & n \text{ tiene un numero par de factores primos} \\ -1 & n \text{ tiene un numero impar de factores primos} \end{cases}$$

Mobius Inversion:

$$g(n) = \sum_{d|n} f(d) \Leftrightarrow f(n) = \sum_{d|n} \mu(d) g(n/d)$$

Otras formulas utiles:
La suma sobre todos los divisores positivos de n de la función de Mobius es cero excepto cuando n = 1. $\sum_{d|n} \mu(d) = [n = 1]$ (Muy util)

$g(n) = \sum_{n|d} f(d) \Leftrightarrow f(n) = \sum_{n|d} \mu(d/n) g(d)$

$g(n) = \sum_{1 \leq m \leq n} f(\lfloor \frac{n}{m} \rfloor) \Leftrightarrow f(n) = \sum_{1 \leq m \leq n} \mu(m) g(\lfloor \frac{n}{m} \rfloor)$

6.1.2 Cycles

Let $g_S(n)$ be the number of n-permutations whose cycle lengths all belong to the set S. Then

$$\sum_{n=0}^{\infty} g_S(n)\frac{x^n}{n!} = \exp\left(\sum_{n\in S}\frac{x^n}{n}\right)$$

6.1.3 Derangements

Permutations of a set such that none of the elements appear in their original position.

6.1.4 Burnside's lemma

Given a group G of symmetries and a set X, the number of elements of X *up to symmetry* equals

$$\frac{1}{|G|}\sum_{g\in G}|X^g|,$$

where X^g are the elements fixed by g ($g.x = x$).

If $f(n)$ counts "configurations" (of some sort) of length n, we can ignore rotational symmetry using $G = \mathbb{Z}_n$ to get

$$g(n) = \frac{1}{n}\sum_{k=0}^{n-1} f(\gcd(n,k)) = \frac{1}{n}\sum_{k|n} f(k)\phi(n/k).$$

$$p(n) \sim 0.145/n \cdot \exp(2.56\sqrt{n})$$

n	0	1	2	3	4	5	6	7	8	9	20	50	100

CircleTangents.h

Description: Finds the external tangents of two circles, or internal if r2 is negated. Can return 0, 1, or 2 tangents – 0 if one circle contains the other (or overlaps it, in the internal case, or if the circles are the same); 1 if the circles are tangent to each other (in which case .first = .second and the tangent line is perpendicular to the line between the centers). .first and .second give the tangency points at circle 1 and 2 respectively. To find the tangents of a circle with a point set r2 to 0.

sphericalDistance.h

Description: Returns the shortest distance on the sphere with radius radius between the points with azimuthal angles (longitude) f1 (ϕ_1) and f2 (ϕ_2) from x axis and zenith angles (latitude) t1 (θ_1) and t2 (θ_2) from z axis (0 = north pole). All angles measured in radians. The algorithm starts by converting the spherical coordinates to cartesian coordinates so if that is what you have you can use only the two last rows. dx*radius is then the difference between the two points in the x direction and d*radius is the total distance between the points.

  double dz = cos(t2) - cos(t1);
  double d = sqrt(dx*dx + dy*dy + dz*dz);
